

LEFT FOOT GAS PEDAL

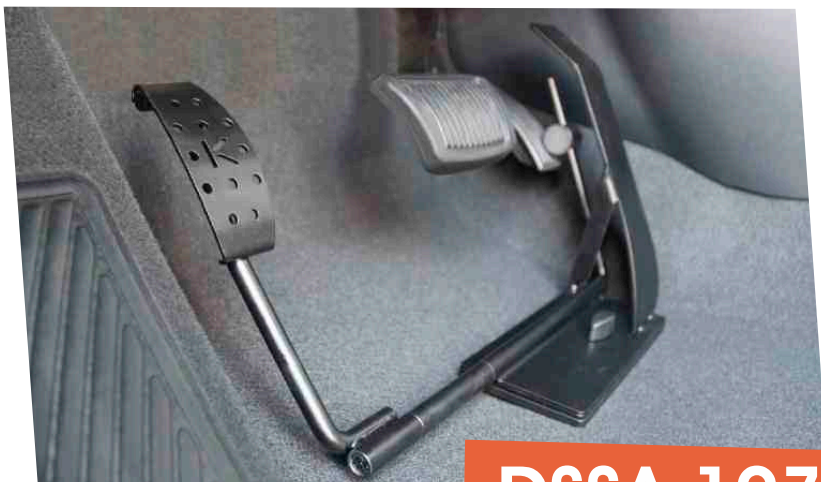

These devices can be installed on cars with both Automatic and Manual gear

DSSE 10

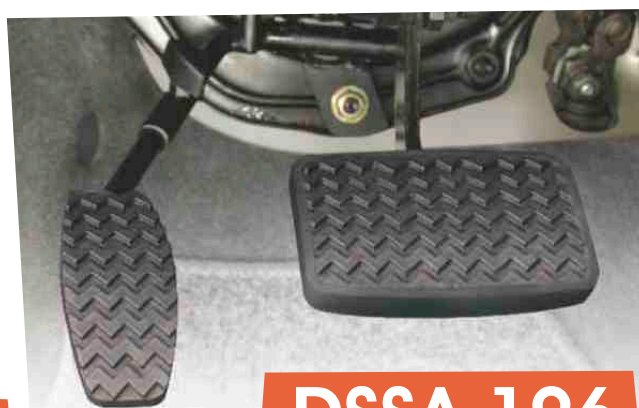

The DSSE 10 can be installed in all the cars with electronic gas pedal. A second gas pedal, identical to the original one, will be installed to the left of the brake pedal. This device is provided with a wiring, which gives the opportunity to choose between the automatic activation of the original pedal or the activation of our device. Our device is programmed for automatic start, but after ignition the driver has 10 seconds to activate the other pedal by simply pushing a button. To change the chosen pedal it's necessary to start the car again.

DSSA 197

Quick release model. The left gas pedal is fixed on the car floor, while a pedal guard on the original gas pedal prevents its inadvertent use. It is quickly released to allow conventional driving when needed. For both automatic transmission and automatic clutch.

DSSA 196

Flip up version. A lever system transfers the gas pedal from the right to the left of the brake pedal. For both automatic transmission and automatic clutch.
