

HANDCONTROLS FOR

GAS & BRAKE

RADIAL HANDCONTROL

Kivi is specialized in manufacturing specific hand-controls for tetraplegic drivers, in a full respect of the driver compartment design. The radial hand-control MR 08 is a lever placed under the steering wheel, which enables the acceleration and the brake by hands. The acceleration is held by simply rotating the handle down. This movement is undemanding and neither hands nor arms get tired out. This device ensures as much comfort as possible during long trips. The brake is held by pushing the lever towards the dashboard and the acceleration returns automatically to idle when the brake is applied. Automatic transmission is required.

All these products are CE marked

This device can also come with some switches for auxiliary functions, such as direction indicators, horn and hill holder (see picture). If the driver's hand cannot clutch the handle, we recommend the push and pull version LAF796 (see below). Acceleration is held by pulling and brake is held by pushing the handle. The device LAF796 can be fitted with a brace (see picture below on the left) which enables the hand to be kept still on the handle.

PUSH & PULL
